IN THE DATED STATES PATENT AND TRADEMARK OFFICE

In re PATENT APPLICATION OF

Group Art Unit: 1655

SEP 1 2 2002

Application Serial No. 09/341,105

F. Abel Ponce de Leon et al.

Examiner: B. Sisson

TECH CENTER 1600/2900

Filed: September 7, 1999

Title: Z-Chromosomal Markers Derived from Chicken (Gallus Domesticus) and

USE THEREOF IN CHROMOSOMAL MAPPING

AMENDMENT AND REPLY

Hon. Commissioner of Patents Washington, D.C. 20231

Sir:

This Reply is responsive to the final Office Action dated March 9, 2002. Kindly enter the following amendment and remarks prior to further examination.

## IN THE SPECIFICATION:

The paragraph beginning on line 19 of page 5 is amended as follows:

## Fluorescent in situ hybridizations

-- The Z-chromosome-specific DNA fragments were fluorescently labeled by PCR with biotin-l6-dUTP (3:1 ratio of dTTP:biotin-l6-dUTP) and passed through a Sephadex G-50 column to remove unincorporated nucleotides. The protocol described by Ponce de Leon (*Proc. Natl. Acad. Sci., USA* (in press) (1996)) was followed. Briefly, 200 nanograms of labeled Z-chromosome specific DNA was mixed with 6  $\mu$ g of chicken competitor DNA (average size 200-400 bp) and 5.8  $\mu$ g of salmon sperm DNA (average size 200-400 bp), precipitated and resuspended in 12  $\mu$ 1 of hybridization buffer consisting of 50% deionized formamide, 1X SSC and 100% dextran sulphate to achieve a final DNA concentration of 1  $\mu$ g/  $\mu$ 1. The hybridization mix was denatured at 75°C for 5 minutes and reannealed at 37°C
